In the claims:

For the Examiner's convenience, all pending claims are presented below with changes shown. Please cancel claims 10 and 17 without prejudice.

(Currently Amended) A method comprising:
 receiving a string of data symbols; and

compressing the string of data into a fixed sized compressed data block having a plurality of compressed symbols and dictionary elements, the compressed symbols and dictionary elements having a fixed length and a fixed offset within the compressed data block.

- 2. (Original) The method of claim 1 wherein compressing the data comprises: dividing a first symbol into a first component and a second component; and comparing the first component with the dictionary elements.
- 3. (Original) The method of claim 2 further comprising compressing the first component to form a first tag if the first component matches a dictionary element.
- 4. (Currently Amended) The method of claim 3 wherein each <u>compressed</u> symbol-includes a tag to indicate a compression type.
- 5. (Original) The method of claim 3 further comprising storing the first component at a dictionary element if the first component does not match a dictionary element.

- 6. (Original) The method of claim 3 wherein compressing the data comprises: dividing a second symbol into a second component and a second component; and comparing the second component with the dictionary elements.
- 7. (Currently Amended) A compression system:

 a register to store a plurality of fixed length data symbols to be compressed;

 compression logic to compress each of the plurality of data symbols to form a

 compressed symbol, the compressed symbols forming a compressed data block having a

 fixed offset; and

a plurality of dictionary registers to store dictionary elements, having a fixed length

the compressed symbols and dictionary elements forming a compressed data block having a fixed length and fixed offset.

- 8. (Original) The system of claim 7 wherein each symbol is divided into a first component and a second component.
- 9. (Currently Amended) The method of claim 8 wherein the first and second components are compressed into fixed length compressed symbols tags.
- 10. (Cancelled)
- 11. (Original) The system of claim 8 wherein the first component is received at the compression logic and encoded to form a tag.

-4-

3037406962

- 12. (Original) The system of claim 11 further comprising a buffer to store the tag and second component of each symbol as the compressed symbol.
- 13. (Currently Amended) The system of claim 8 wherein the compression logic comprises:

dictionary matching logic to determine if the first component matches a dictionary element; and

constant no match logic to determine if the second component has all ones or all zeroes.

- 14. (Original) The system of claim 13 wherein the compression logic comprises an encoder coupled to the match logic and the no match logic to encode the first component to form a tag if the first component matches a dictionary element, has all ones or zeroes.
- 15. (Currently Amended) A method comprising:

receiving a fixed offset compressed data block having a plurality of dictionary elements and compressed symbols; and

decompressing each of the compressed symbols in parallel, by:

analyzing a tag component within a compressed symbol; and

decompressing the compressed symbol to form a symbol based upon the
tag value.

-5-

- 16. (Original) The method of claim 15 wherein each of the compressed symbols are decompressed simultaneously.
- 17. (Cancelled)
- 18. (Currently Amended) The method of claim 15 17 wherein decompressing the compressed symbol to form a symbol based upon the tag value comprises:

decoding the tag to form a matched component of the symbol; and combining the matched component with an unmatched component within the compressed symbol to form the symbol.

- 19. (Currently Amended) A decompression system comprising:
- a plurality of decompression units to decompress a corresponding compressed symbol within a compressed data block having a plurality of compressed symbols and dictionary elements having a fixed length and fixed offset to generate an uncompressed symbol, wherein the decompression units decompress the compressed symbols in parallel.
- 20. (Original) The system of claim 19 wherein the compressed symbol comprises a tag component and an unmatched symbol component.
- 21. (Original) The system of claim 20 wherein each decompression unit comprises logic to decode the tag component of a compressed symbol to generate a matched symbol component.

-6-

- 22. (Original) The system of claim 21 wherein each decompression unit combines a matched symbol component with the unmatched symbol component to form an uncompressed symbol.
- 23. (Original) A computer system comprising:

a central processing unit (CPU);

a cache memory coupled to the CPU having a plurality of compressible cache lines to store additional data; and

a cache controller comprising compression logic to compress each of the plurality of cache lines by compressing the data within a compressed cache line into a fixed sized compressed data block having a plurality of offset compressed symbols and dictionary elements, the symbols and dictionary elements having a fixed length and fixed offset.

- 24. (Original) The computer system of claim 23 wherein the cache controller further comprises decompression logic to decompress compressed symbols within a compressed data block to generate uncompressed symbols.
- 25. (Original) The computer system of claim 24 wherein the decompression logic decompresses the compressed symbols in parallel.
- 26. (Original) A computer system comprising:

a central processing unit (CPU);

a cache memory coupled to the CPU having a plurality of compressible cache lines to store additional data;

Docket No. 42P17035 Application No. 10/676,430

-6-

a chipset, coupled to the CPU and the cache memory, including:

compression logic to compress each of the plurality of cache lines by compressing the data within a compressed cache line into a fixed sized compressed data block having a plurality of offset compressed symbols and dictionary elements, the symbols and dictionary elements having a fixed length and fixed offset; and

a main memory coupled to the chipset;

- 27. The computer system of claim 26 wherein the chipset further (Original) comprises decompression logic to decompress compressed symbols within a compressed data block to generate uncompressed symbols.
- 28. (Original) A method comprising: receiving a fixed offset compressed data block having a plurality of dictionary elements and compressed symbols; and

decompressing a randomly accessed and a first compressed symbol within the compressed data block.

The method of claim 28 wherein decompressing the first 29. (Original) compressed symbol comprises:

analyzing a tag component within a compressed symbol; and decompressing the compressed symbol to form a symbol based upon the tag value.
